Apparatus for controlling the flow of molten metal from a holding vessel such as a tundish through a discharge orifice into a receptacle such as a mould; comprising

(i) a flow control member within the holding vessel, said member comprising a down-flow chamber separate from but in fluid communication with the interior of the holding vessel, the down-flow chamber having an outlet at its lower end, said outlet leading to or forming part of the discharge orifice of the vessel and an opening towards or at its upper end;

(ii) means such as herein described for creating a gas pressure within the flow control member sufficient to allow molten metal from the holding vessel interior to pass through the opening to establish in the lower end of the down-flow chamber a column of the molten metal with a volume of gas occupying the upper end of the flow control member and separating the column of molten metal from the opening, in use, to establish an equilibrium between molten metal passing through the opening and molten metal passing out through the discharge orifice such that the height of the column of molten metal in the down-flow chamber remains substantially constant; and

(iii) means such as herein described to reduce the said volume of gas; for increasing the height of the column of molten metal and thus the flow rate through the discharge

orifice and (b) means such as herein described to increase the said volume of gas, for reducing the height of the said column and thus the said flow rate.
